I have trouble with Intel Xeon Gold 6130, 2.9 GHz, 6 cores with Ubuntu 12.04. I am using Linux kernel 3.5.4. When i start my application and reach my embedded application, i get this message: Cannot fork to meet request for 256k: Too many open files. My question is: What is the right way to increase the number of open file descriptor limit for this cpu? Any other issues with this config? This application has to access huge amount of data to process and i think i have a problem with the capacity of the embedded toolchain. I have to study it a bit and as soon as i get the right answer, i will post it. Thanks A: Turn off multiprocessing. If you need to pass chunks of data to a multiprocessing.Process from outside that process, you should not pass them via a Queue. Chunks of data should be passed as the contents of a memoryview object, however, the memoryview object is then shared across all processes, which is not necessary. Authors Date of this Version March 1991 Comments Published in: Microbiology vol. 7, pp. 989-993. Abstract Yersinia enterocolitica, the cause of yersiniosis, has been isolated from a variety of wild and domestic animals, including dogs, birds, and fish. It is thought to be transmitted by the fecal-oral route. Yersinia enterocolitica O:3 biotype 13/28 has been isolated from many animal species and from human faeces. The strain 18/O:3 belongs to serotype O:3 and is classified as a subgroup S. It is typical of human yersiniosis (Schroeder, 1972) and has been detected in the feces of dogs, cats, and some cattle (Peltonen et al., 1984; Halliday et al., 1986). This study was undertaken to determine the biotypes of serotype O:3 yersiniae isolated from children. Yersinia enterocolitica O:3 biotype 13/28/S13 was isolated from a fecal specimen of a three-year-old girl from London, Ontario, on November 22, 1980. Colonies were non-82157476af
